ABSTRACT

Part of the continuing reports of data analysis of school and college enrollment, this report focuses on changes in college enrollment as affected by: family income; the changing size of the armed forces; the means of obtaining a high school diploma; and the type of degree being sought by college students. Following a brief narrative, the report consists primarily of tables and graphs of the statistical data. Several conclusions are drawn from the data: (1) recent changes in the education benefits of the GI bill lowered the level of college enrollment in the fall of 1976; (2) young adults from high income families are still more likely to attend college than are those from low income families; (3) about 95% of 1975 high school graduates received their diplomas upon graduation with their high school class; and (4) 10% of undergraduates in the first three years of college were reported to be attending college for purposes other than to obtain a college degree. School Enrollment—Social and Economic Characteristics of Students: October 1976

INTRODUCTION

This report presents an analysis of data for October 1976 from the Current Population Survey (CPS) on recent changes in school and college enrollment. The statistical tables present data on school enrollment patterns in 1976 for students attending nursery school through college by demographic and socioeconomic characteristics such as age, race, sex, marital status, household relationship, and family income level. These tables are limited to persons enrolled in regular school (nursery school, kindergarten, elementary school, high school, and college or professional school) and exclude persons enrolled in vocational school or adult education classes.

An earlier report on the October 1976 data showed that the following major trends in school enrollment have occurred.¹

- There was no significant change from October 1975 to October 1976 in the total number of students 3 to 34 years old enrolled in school.
- The number of students enrolled in nursery school declined for the first time since these data were first collected by the Census Bureau in 1964.
- The trend of declining elementary school enrollment continued; it has decreased 12 percent since 1970.
- College enrollment did not change significantly from 1975 to 1976 following a 10 percent increase in the preceding year.
- College enrollment of Black students 14 to 34 years old reached 1.1 million in 1976, about twice the number enrolled in 1970.

This report focuses on changes in college enrollment by family income, the effect of the changing size of the Armed Forces in the 1960's and 1970's on enrollment rates of young men, means of obtaining a high school diploma, and type of degree being sought by college students.

College Enrollment and the GI Bill

Recent changes in the education benefits of the GI bill (chapter 34, title 38, of the U.S. Code) might have affected the level of college enrollment in the fall of 1976. In November 1975, a period of high unemployment, 1.3 million

veterans were enrolled in college under the GI bill; by November 1976 the figure dropped to about 835,000. This reduction in the number of GI bill college enrollees could be attributed in large part to changes in the law and the imposition of a delimiting date, May 31, 1976, which eliminated peacetime post-Korean veterans from participation in college training and, consequently, dropped many older veterans from the rolls. In 1975, 12 percent of all college students were funded by the GI bill, as compared with only 8 percent in 1976.²

According to the Veterans Administration, a majority of veterans attending college under the GI bill in 1976 were in junior colleges. Six out of ten undergraduate veterans were attending junior colleges, compared with 3 out of 10 for all undergraduates. Between 1975 and 1976, junior college enrollment of GI bill participants dropped by about 259,000 (36 percent). This downward shift in enrollment of veterans probably affected the total number of students in junior colleges. CPS data show that among persons 14 to 34 years old, 2-year college enrollment did not increase between October 1975 and 1976. Also, there is some evidence of a slight decline in 2-year college enrollment among men between 1975 and 1976 as compared with a substantial increase between 1974 and 1975.³ A surge in total college enrollment by veterans eligible for GI benefits occurred in 1975 when the delimiting date was passed by Congress; in that year enrollment of veterans in college rose by one-third, but by 1976 college enrollment under the GI bill had dropped below the 1974 level.

College Enrollment and Armed Forces Participation

College enrollment figures by age and sex have been available from the CPS for the civilian noninstitutional population only. Since Armed Forces participation of young men is concentrated in the same age span as college attendance, changes in Armed Forces levels can appreciably affect college enrollment rates. The civilian college enrollment rate by age will provide a reliable measure of the changes in enrollment over time, if the size of the Armed Forces remains stable. However, if the size of the Armed Forces varies, as it did in the last half of the 1960's, the civilian population also changes and thereby affects the base for the college enrollment rate of males.

Figure 2a. College Enrollment of the Population 18 to 24 Years Old by Sex:
October 1960 to October 1976

Figure 2b. Armed Forces Participation of Men 18 to 24 Years Old by Age:
October 1960 to October 1976

Figure 2c. College Enrollment of the Population 18 to 24 Years Old for All Men, Including the Armed Forces, and Civilian Men and Women, by Age: October 1960 to October 1976

Note: Civilian enrollment rate is based on the civilian noninstitutional population only; the total enrollment rate for men is derived by dividing the civilian population enrolled in college by the total population of men including the Armed Forces. For this chart and table A-4 Armed Forces personnel are assumed not to be enrolled in college. Figures for women are based on the civilian population only because the Armed Forces involvement of young women has been quite small.

In this section college enrollment rates of young men are compared in terms of "civilian enrollment rates" based on the civilian population only, and "total enrollment rates" based on the total population including the Armed Forces overseas. This adjusted college enrollment ratio based on the total population assumes that none of the men in the Armed Forces were in college, an assumption known to be false; but the changes in the college enrollment level of civilian men as shown by this ratio more accurately reflect the true changes in total population and the number enrolled.

From 1965 to 1969, the number of men 18 to 24 years old in the Armed Forces increased by about one-half, from 1.5 to 2.2 million; but the proportion of the age group increased only from 15 to 19 percent because the size of the group also increased. By 1976, this number had dropped to 1.1 million or to about 8 percent of the age group. The most dramatic shifts in the Armed Forces population occurred among 20- and 21-year-old males (table A-4). In 1968, 30 percent of these young men were in the Armed Forces; this meant that the civilian enrollment rate was based on 70 percent of the population in the age group and that rate was about 44 percent. By 1976, when only 9 percent of the age group was in the Armed Forces, the civilian enrollment rate dropped to 32 percent. However, when enrollment for 20- and 21-year-old civilian young men is based on the total population including the Armed Forces (considered to be not enrolled in school), the total enrollment rate was 30 percent in 1968 and 29 percent in 1976, not a significant difference. The difference in rates based on the civilian population lends support to the hypothesis that many young men only enrolled in college during the Vietnam era to avoid the draft; however the rates based on the total population indicate that the rates of college enrollment during the period were relatively steady.

The rapid increase followed by the equally rapid decline in the college enrollment rate of civilian men 20 and 21 years old between 1965 and 1971 was not duplicated by changes in the enrollment rate based on the total population but reflects the trend of changes in Armed Forces participation during the Vietnam era as figure 2 shows. The enrollment rate based on the total population increased slowly through the early 1960's and has remained at or near 30 percent since that time. Enrollment rates also rose in the 1960's for 22- to 24-year-olds, although their military and college enrollment rates were never as high as for the younger group. The total enrollment rate of 22- to 24-year-old men remained high after the Vietnam era, perhaps in part because some men who were in the Armed Forces at around 20 years of age took advantage of veterans' benefits and enrolled in college at a later time. Perhaps enrollment increased because of the draft laws during the Vietnam era, but even after the threat of the draft had passed, men 20 years old and over continued their higher education at the same rate.

Since 1960, fewer than 15 percent of men 18 and 19 years old have been members of the Armed Forces. Enrollment rates for men in this age group increased among both civilians and the total population in the late 1960's; sub-

sequently, the total enrollment rate did drop off from 39 percent in 1968 and 1969 to 33 percent in 1976, not significantly different from the enrollment level of the early 1960's.

After the increase in enrollment rates of males in the late 1960's, some expected that enrollment of young students would be curtailed⁴ and that colleges would suffer a loss in enrollment which would result in an oversupply of facilities and personnel. Actually, total enrollment rates for all 18- to 24-year-old men have varied little in the last 10 years and were not significantly different in 1976 from 1966. For women the proportion enrolled has increased (figure 2). The warnings about college graduates not obtaining jobs commensurate with their learned skills when they finish apparently have not deterred many potential students from enrolling.

Women 18 to 24 years old have continued to increase their college enrollment during the 1970's until it has met the level for all men. Women 18 to 21 years old have exceeded the enrollment rate for men; at older ages they remain slightly behind.

College Attendance and Family Income

Family income has long been associated with college attendance.⁵ Young adults from high income families are much more likely to attend college than are those from low income families. Although there may have been some lessening of the differences in rates by income level since 1967, persons 18 to 24 years old in 1976 whose families have at least \$15,000 in income (1967 dollars) were still about three times as likely to attend college as were young adults from families with less than \$3,000 income (table A-5).

Figures 1, 3, and 4 and table A exhibit college enrollment rates of dependent family members 18 to 24 years old (defined as relatives, but not wives, of the family head). These persons are primarily sons and daughters of the head. The data show that, overall, enrollment rates were not different in 1976 than they were in 1967; only for persons in the top income groups (\$10,000 and over) have rates declined significantly (figure 1). There was no significant change for those of lower incomes.

Family income was standardized to 1967 dollars in table A-5 to allow comparison of similar income groups over time. With about 70 percent inflation from 1967 to 1976, comparison of income groups in current dollars becomes distorted; \$15,000 in 1967 had the same buying power as about \$25,600 in 1976. The Consumer Price Index for 1976 is 170.5 based on an index of 1967 dollars = 100.0.⁶

⁴ Richard B. Freeman, *The Overeducated American*, New York: Academic Press, 1976.

⁵ U.S. Bureau of the Census, *Education of the American Population* by John K. Folger and Charles B. Nam (a 1960 census monograph).

⁶ U.S. Department of Labor, Bureau of Labor Statistics, *Monthly Labor Review*, Vol. 100, No. 3, March 1977.

Approximate comparable buying power of 1967 and 1976 dollars is as follows:

1967 dollar		1976 dollars
\$ 3,000	=	\$ 5,115
\$ 5,000	=	\$ 8,525
\$ 7,500	=	\$12,788
\$10,000	=	\$17,050
\$15,000	=	\$25,575

Two limitations of the data on trends in enrollment by family income should be noted. First, since these data are based on the civilian noninstitutional population, changes over time in the proportion of young men of college age who were in the Armed Forces and thus omitted from the population base could influence computation of school enrollment rates. Discussion in the preceding section showed that the increased enrollment rate for civilian men, in years when the strength of the Armed Forces was greatest, was largely artificial. The change in rates for dependent men of all incomes, shown in figure 3, was similar to that for civilian men in figure 2a, that is, a general decrease of about 8 percentage points from 1969 to 1976, with little change since 1972.

The second limitation relates to young women in their parents' households. The direction and magnitude of the trends are probably real but total enrollment rates compared with those for men may be inflated. Since women generally marry at younger ages than men, they are less likely to be in their parents' households; about half of the women 18 to 24 years old, but only a third of the men, who were not in school were married, in their own households, and no longer dependent family members in 1976 (table 10). The absence of a greater number of young women from their parental homes deflates the base for computation of rates for women more than for men and therefore inflates the enrollment rates for women to some extent.

Although important changes occurred between 1967 and 1976 in college enrollment rates by sex and income level for all dependent family members 18 to 24 years old, the proportion enrolled in college in 1976 was not significantly different from the proportion enrolled in 1967 (figure 1). This stability resulted from a decrease of 8 percentage points for young men over the period and a comparable increase for women (figures 3 and 4). For both sexes combined, the period showed a decline in enrollment rates to 1973 and then a recovery by 1976 (table A). A similar trend was apparent for the two middle income groups, (families with incomes of

\$5,000 to \$9,999 and \$10,000 to \$14,999) but for members of high income families, the enrollment rate decreased significantly (10 percentage points) over the entire period. For members of low income families (less than \$5,000) enrollment rates did not change significantly.

The concern expressed with some reason in the early 1970's that the enrollment of middle income students was declining compared with other income groups⁷ appears to be alleviated now. By 1973, the enrollment rates of persons in families with incomes of \$5,000 to \$14,999 had dropped below earlier levels, while persons in lower income families remained relatively stable. By 1976 the trend of declining enrollment of middle income students had reversed and returned to the higher levels. The decrease to around 1973 seems to have combined different trends for males and females. There was a large drop in enrollment for males, coincident with the shift in the Armed Forces as discussed earlier, and a relatively stable enrollment rate for females. The recovery by 1976 was due to a combined leveling of enrollment rates for males of middle income and rise in rates for females of comparable incomes (figures 3 and 4).

The decrease for all men was probably a result of the decrease in the proportion in the Armed Forces, as discussed earlier. As the proportion of all men enrolled decreased 8 percentage points between 1967 and 1976, there were decreases for all income groups except the lowest. For men in the highest income families (\$15,000 and over) the decrease was twice that of all men.

The trend for women shows an increased rate of enrollment in each income group in the last few years (figure 4). Significant increases in the enrollment rate occurred after 1973. Before that year, fluctuations were minor and, for the

most part, not statistically significant. Only for women in high income families (\$15,000 and over) was the enrollment in 1976 not significantly different from the rate in 1967.

The speculation that, with government aid for low income students and the greater ability to bear costs by high income families, the children of middle income families, who neither qualify for aid nor can as well afford escalating costs, are being squeezed out of the opportunity for higher education is not substantiated in the new CPS data. Figure 1 shows the enrollment rates of middle income youth since 1973 restored to levels equal to or near the 1967 levels. It is possible that the entire downward trend seen earlier was attributable to the decrease in the participation of men in the Armed Forces. Differences in enrollment rates between income groups have decreased; however, large disparities between enrollment rates of low income families and high income families endured.

The study of changes in college enrollment rates of various income groups can also be approached through examination of the distribution of students by family income. The income distribution of students has changed over time, but so has the income distribution of all dependent family members 18 to 24 years old (table B). Although income is standardized to 1967 dollars in table A-5 and the derived charts to account for inflation, real income has risen since 1967; consequently, the income distribution has shifted upward. The proportion of dependent family members and college students in high income families has therefore increased, the proportion in middle income families has decreased, and the proportion in low income families has stayed about the same.

In the 9-year period from 1967 to 1976, the college enrollment rate of all male dependent family members dropped 8 percentage points (table A-5); for men in the highest income families, the enrollment rate dropped substantially more. However, the rise in real income increased the total size of the group so that the proportion of de-

⁷U.S. Bureau of the Census, *Current Population Reports*, Series P-23, No. 51, "Characteristics of American Youth." The data shown in this report were for families with one or more members 18 to 24 years old.

¹Excludes persons for whom income was not reported.

Note: Dependent family members are relatives of the family head, excluding the wife.

Figure 3. College Enrollment Rates of Male Dependent Family Members 18 to 24 Years Old, by Family Income (in 1967 Dollars): October 1967 to October 1976

Figure 4. College Enrollment Rates of Female Dependent Family Members, 18 to 24 Years Old, by Family Income (in 1967 Dollars): October 1967 to October 1976

pendent male college students in the top income group increased from 19 to 27 percent. At the same time, male students in families with less than \$5,000 income remained at about 12 percent, and the proportion of middle income students from families with incomes of \$5,000 to \$9,999 declined. For dependent women, on the other hand, the total enrollment rate grew 8 percentage points in the period, but the distribution of women enrolled in school by family income did not change significantly.

In summary, although students from middle income families declined as a proportion of all students, the change seems to have been related to a change in real income of families rather than a "squeezing out" of the middle income students. The changes in income distribution of all young adults and students were not significantly different; hence, it cannot be concluded that there was a disproportionate drop in college enrollment among middle income youth.

High School Diplomas and College Degrees

In the October 1975 CPS supplement on school enrollment, an attempt was made to gather new information on the means of acquiring a high school and college degree so that current information on the number of persons who completed 4 years of high school and the number of persons enrolled in college could be evaluated. Persons 18 to 34 years old who had completed 4 years of high school were asked to report whether they had graduated after having attended with their high school class, after having attended night school, or after having taken an equivalency examination to graduate. This information would provide a national estimate of the number of high school graduates who complete high school by taking equivalency examinations and who are thereby increasing the level of education of the U.S. population.⁴ Likewise, students enrolled in college were asked to name the degree that they were seeking. According to the definition of college enrollment in the CPS, a college student must be enrolled in a program which provides credit applicable to a bachelor's degree. Recent discussion about colleges broadening their entrance requirements to enroll more students in nontraditional programs suggests that current statistical measures of college enrollment may include many nontraditional students. One purpose of this analysis was to determine the number and characteristics of persons identified as "college students" in the CPS but who were not actually seeking a college degree.

In 1975, about 8 out of 10 persons 18 to 34 years of age had completed 4 years of high school. About 95 percent of these received their diploma upon graduation with their high school class. The remainder took the General Educational Development Test (GED), attended night school until they completed the requirements for high school

graduation, or graduated by some other means (table C). For those persons who did not graduate with their high school class, the most common alternative method of completing high school was by passing the GED exam, especially for persons over age 24. Of high school graduates 25 to 34 years old, about 4 percent had passed the GED exam, 6 percent of men and 2 percent of women. Thus, a significant number of high school graduates are added to the population through the GED program, especially men who may have taken the examination as part of Armed Forces programs. Black men are less likely than White men to obtain a high school diploma through the GED program, but the tendency for men of Spanish origin to receive a GED diploma is not measurably different from all men. Graduation by night school was infrequent. Of all graduates 18 to 34 years old, about 1 percent completed high school requirements in this way.

Undergraduates enrolled in the first 3 years of college reported which degree they were currently seeking (table B-2). For about 13 percent of the persons, degree intentions were not reported, perhaps because a large proportion of college students attend college away from home, and their degree status is provided by some other family member who sometimes does not know the specific intentions of the student. There is no way to estimate the degree status of those students. About one-half of the students reported they were seeking a bachelor's degree and a little over one-fourth were seeking an associate of arts degree. Those seeking an associate of arts degree were asked whether the degree was an academic or applied degree. Data not included in this report show that 7 percent did not respond, 4.5 percent said "applied," and 88 percent said "academic." Thus, three-fourths of the undergraduates in this study were identifiable as degree-seeking college students. Another 5 percent were seeking vocational diplomas and 5 percent said they were not seeking a college degree at all. These nondegree students were likely to be enrolled part time (87 percent of about 375,000) and to be older than those seeking a traditional degree. Students who said they were seeking a vocational diploma would not be considered "traditional" college students because they were not seeking a degree transferable to a bachelor's program. As would be expected from the programs offered by the different institutions of higher education, a high proportion (74 percent) of vocational students were enrolled in 2-year colleges.

Altogether, about 800,000 students (10 percent of undergraduates in the first 3 years of college) were reported to be attending college for purposes other than to obtain a college degree. These students were more likely than the degree-seeking students to be enrolled part time, to be over age 25, and to be attending 2-year colleges. Nearly all students in the youngest age group, 14 to 24 years old, who reported whether they were working toward a degree, were seeking an associate or bachelor's degree; only 8 percent were seeking vocational diplomas or had no degree plans. More detailed tables on the means of acquiring a high school diploma or

⁴ GED Statistical Report, 1975, General Educational Development Testing Service of the American Council on Education, One Dupont Circle, Washington, D.C.

college degree are available upon request from the Population Division of the Bureau of the Census, Washington, D.C. 20233.

RELATED REPORTS

Advance data on school enrollment for October 1976 were presented in Series P-20, No. 309. Statistics on school enrollment for October of the years prior to 1976 have been published in other reports in Series P-20. See back cover for list.

Data on the relationship between preprimary enrollment of children and labor force participation of mothers were presented in **Current Population Reports**, Series P-20, No. 318, "Nursery School and Kindergarten Enrollment of Children and Labor Force Status of Their Mothers: October 1967 to October 1976."

Statistics on school enrollment for cities, standard metropolitan statistical areas, States, regions, and the United States appear in reports of the decennial censuses. Detailed statistics on school enrollment by age and socioeconomic characteristics for regions and the United States are presented in Subject Reports of the 1970 census, especially in PC(2)-5A School Enrollment.

Figures on school enrollment from the October Current Population Survey differ from decennial census data for reasons in addition to the difference in the dates. In the

first place, the survey data exclude the institutional population and members of the Armed Forces. These two groups were included in the census. Second, there were differences in field work. The small group of Current Population Survey enumerators were more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Third, the census was taken in April and relates to enrollment since February 1, whereas the surveys were taken in October and relate to enrollment in the current term. This difference in months of the year affects not only the extent of school enrollment (through "dropouts" during the school year, etc.) but also the level of school in which persons of a given age are enrolled.

Data from school systems. Information on college enrollment is also collected and published by Federal, State, and local governmental agencies, and by independent research organizations. This information is generally obtained from reports of school systems and institutions of higher learning, and from other surveys and censuses. These data are only roughly comparable with data collected by the Bureau of the Census by household interviews, however, because of differences in definitions, subject matter covered, and enumeration methods. The census data are subject to sampling variability, which may be relatively large where numbers for specific age or population groups, or for given school categories, are small.

¹Based on persons who reported the method of completion.

Note: Persons of Spanish origin may be of any race.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

¹Estimated Armed Forces participation.

Note: Persons in college are civilians only.

Figures for the civilian population and persons enrolled in college may differ from previous reports because revised civilian and Armed Forces figures were used for 1963 to 1975.

**Table A-5. College Enrollment for Dependent Family Members 18 to 24 Years Old by Family Income and Sex:
October 1967 to October 1976**

(Family income in 1967 dollars. Numbers in thousands. Civilian noninstitutional population)

¹The high nonresponse on income for the years 1967 through 1969 was caused by apparent random errors in CPS processing. Some persons were not matched back to their family records and, hence, did not receive the family income codes.

Note: A dependent family member is a relative of the primary family head other than the wife.

Appendix C

DEFINITIONS AND EXPLANATIONS

Population coverage. The figures shown are for the civilian noninstitutional population.

Symbols. A dash “—” represents zero or rounds to zero, and the symbol “B” means that the base for the derived figure is less than 75,000. Three dots “...” mean not applicable, and “NA” means not available.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or “twin cities” with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

School enrollment. The school enrollment statistics from the current surveys are based on replies to the enumerator's inquiry as to whether the person was enrolled in school. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of graded public, parochial, or other private school in the regular school system. Such schools include nursery schools, kindergartens, elementary schools, high schools, colleges, universities, and professional schools. Attendance may be on either a full-time or part-time basis and during the day or night. Thus, regular schooling is that which may advance a person toward an elementary or high school diploma, or a college, university, or professional school degree. Children enrolled in nursery schools and kindergarten are included in the enrollment figures for “regular” schools, and are also shown separately.

“Special” schools are those which are not in the regular school system, such as trade schools or business colleges. Persons attending “special” schools are not included in the enrollment figures.

Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study, and in training courses given directly on the job, are also excluded from the count of those enrolled in school, unless such courses are being counted for credit at a “regular” school.

College enrollment. The college enrollment statistics are based on replies to the enumerator's inquiry as to whether the person was attending or enrolled in college. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year, except those who have left for the remainder of the term. Thus, regular college enrollment includes those persons attending a 4-year or 2-year college, university or professional school (such as medical or law school), in courses that may advance the student toward a recognized college or university degree (e.g. BA or MA). Attendance may be either full time or part time, during the day or night.

Two-year and four-year college. Students enrolled in the first 3 years of college were asked to report whether the college in which they were enrolled was a 2-year college (junior or community college) or a 4-year college or university. Students in the fourth academic year of college or higher were assumed to be in a 4-year college or university.

School enrollment in year preceding current survey. An inquiry on enrollment in regular school or college in October of the preceding year was asked in the survey concerning persons 14 to 24 years old who were not currently attending regular school or who were enrolled in college.

Level of school. The statistics on level of school indicate the number of persons enrolled at each of five levels: Nursery, kindergarten, elementary school (first to eighth grades), high school (ninth to twelfth grades), and college or professional school. The last group includes graduate students in colleges or universities. Persons enrolled in junior high school through the eighth grade are classified as in elementary school and the others as in high school.

Nursery school. A nursery school is defined as a group or class that is organized to provide educational experiences for children during the year or years preceding kindergarten. It includes instruction as an important and integral phase of its program of child care. Private homes in which essentially custodial care is provided are not considered nursery schools. Children attending nursery school are classified as attending during either part of the day or the full day. Part-day attendance refers to those who attend either in the morning or in the afternoon, but not both. Full-day attendance refers to those who attend both in the morning and afternoon.

"Head Start." Children enrolled in "Head Start" programs or similar programs sponsored by local agencies to provide preschool education to young children are counted under "Nursery" or "Kindergarten" as appropriate.

Public or private school. In this report, a public school is defined as any educational institution operated by publicly elected or appointed school officials and supported by public funds. Private schools include educational institutions established and operated by religious bodies, as well as those which are under other private control. In cases where enrollment was in a school or college which was both publicly and privately controlled or supported, enrollment was counted according to whether it was primarily public or private.

Full-time and part-time attendance. College students were classified, in this report, according to whether they were attending school on a full-time or part-time basis. A student was regarded as attending college full time if he was taking 12 or more hours of classes during the average school week, and part time if he was taking less than 12 hours of classes during the average school week.

Modal grade. Enrolled persons are classified according to their relative progress in school, that is, according to whether the grade or year in which they were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey. The modal grade, then, is the year of school in which the largest proportion of students of a given age is enrolled.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Spanish origin. Information on origin or descent was obtained by asking "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself or his parents. The category Spanish origin includes persons of Mexican, Puerto Rican, Central or South American, and other Spanish origin.

Marital status. The marital status category shown in this report, "married, spouse present," includes persons who are currently married and living with their spouse.

Family. The term "family," as used here, refers to a group of two persons or more related by blood, marriage, or adoption and residing together; all such persons are considered as members of one family.

Primary family. A primary family is a family that includes among its members the person or couple who maintains the household.

Head of family. One person in each family residing together was designated as the head. The head of a family is usually the person regarded as the head by members of

the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey.

Primary family members. All members of the family that includes the person or couple who maintains the household are considered primary family members.

Dependent family members. For the purpose of this report, a dependent family member is a relative of the family head, excluding the head's wife. Such persons are generally sons and daughters of the family head. Family members who are living away from home while attending college are also counted as dependent family members.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate, high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Family income. Income as defined in this report represents the combined total money income of the family before deductions for personal taxes, Social Security, bonds,

etc. It is the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings received by all family members during the 12 months prior to the surveys. It should be noted that although the family income statistics refer to receipts during the previous 12 months, the characteristics of the person, such as age, marital status, etc., and the composition of families refer to the date of the survey.

The income tables include in the lowest income group those who were classified as having no income in the previous 12 months and those reporting a loss in net income from farm and nonfarm self-employment or in rental income.

The detailed income tables in this report include a separate category for families for which no income information was obtained. In most of the other Current Population Survey Reports showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the October control card are based on the respondent's estimate of total family money income for the preceding 12 months coded in broad, fixed income intervals. Income data collected in the March supplement to the Current Population Survey are based on responses to 11 direct questions asked of all persons 14 years old and over identifying 23 different sources of income and cover the preceding calendar year. (See table C-1)

Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonreporting while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions.

Income data in tables 12, 13, 14, and 25 are in 1976 current dollars. For tables A and A-5 income is shown in 1967 constant dollars and income intervals as used in 1967.

Table C-1 October CPS Control Card Family Income and March CPS Supplement Family Income: 1967 to 1976

(For meaning of symbols, see text)

Year	Median family income, October control card	Percent change	Median family income, March supplement	Percent change	October-March ratio
1967.....	\$6,575	...	\$7,974	...	0.82
1968.....	7,060	7.4	8,632	8.3	0.82

1975.....	11,031	3.6	13,719	6.3	0.80
1976.....	11,644	5.6	14,958	9.0	0.78

^rMarch 1974 figures revised.

Consumer Price Index. The Consumer Price Index (CPI) is a monthly statistical measure of the average change in prices of goods and services purchased by urban wage earners and clerical workers for day-to-day living. It is based on prices of about 400 "marketbasket" items selected to represent all consumption goods and services purchased by these workers.¹ The CPI is currently based on an index of 100.0 = 1967 prices.

Consumer Price Index

YEAR	INDEX	YEAR	INDEX
1967	100.0	1972	125.3
1968	104.2	1973	133.1
1969	109.8	1974	147.7
1970	116.3	1975	161.2
1971	121.3	1976	170.5

¹U.S. Department of Labor, Bureau of Labor Statistics, *Monthly Labor Review*, Volume 100, Number 3, March 1977.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. Most of the estimates contained in these tables are based on data obtained from a supplement to the Current Population Survey (CPS) in October 1976. Some of the data in the tables are based on data obtained from similar supplements to CPS in October of each of the years 1947, 1950, 1955, and 1960 through 1975.

Current Population Survey (CPS). The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section "Nonsampling Variability" below). Samples for previous sample designs were selected from files the census most recently completed at the time. The following table provides a description of some aspects of the Current Population Survey design.

Description of the Current Population Survey

Time period	Number of sample areas ¹	Households eligible		Households visited, not interviewed ²
		Interviewed	Not interviewed	
August 1972 to present.....	461	45,000	2,000	8,000
August 1971 to July 1972.....	449	45,000	2,000	8,000
January 1967 to July 1971.....	449	48,000	2,000	8,500
March 1963 to December 1966.....	357	33,500	1,500	6,000
January 1960 to February 1963.....	³ 333	33,500	1,500	6,000
May 1956 to December 1959.....	330	33,500	1,500	6,000
February 1954 to April 1956.....	230	21,000	500-1,000	3,000-3,500
August 1947 to January 1954.....	68	21,000	500-1,000	3,000-3,500

¹Beginning in May 1956, these areas were chosen to provide coverage in each State and the District of Columbia.

²These are households which were visited, but were found to be vacant or otherwise not be interviewed.

³Three sample areas were added in 1960 to represent Alaska and Hawaii after statehood.

The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old or older in each sample household. In the recent October supplements questions concerning educational characteristics, such as school enrollment, have been asked to acquire information about all levels of education.

The estimation procedure used for both the CPS data and supplemental data involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1970 Census of Population; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions and enumerators. There are two types of errors possible in an estimate based on a sample survey - sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors in surveys can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all sample households and all persons within sample households (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the biases due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been

adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population, with differentials by age, sex, and race similar to those observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S. about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to the 1970 census but building was not completed by the time of the census (i.e., April 1970). Most conventional new construction, for which building permits were issued after the census, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the whole of the population was surveyed. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error, and about 95 out of 100 that the difference would be less than twice the standard error.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated differences is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Percent distributions are shown in the report only when the base of the percentage is 75,000 or greater. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated totals are shown, however, even though the relative standard errors of these totals are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Standard error tables and their use. In order to derive standard errors that would be applicable to a larger number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, these sets of standard

errors (along with factors) provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables C-2 through C-7 provide approximations to standard errors of various estimates shown in this report. Estimated standard errors cannot be obtained from tables C-2 through C-4, however, without the use of table C-9. The numbers in tables C-9, or combinations of them, correspond to the Total-Persons-in-Age-Group column headings in tables C-2 through C-4.

Table C-8 provides factors which must be used to calculate standard errors for each characteristic. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic. For example, to produce approximate standard errors for the marital status of Spanish origin persons, multiply the appropriate figures in tables C-4 or C-7 by the factor 1.4 from table C-8. The determination of the proper factor for a percentage depends upon the subject matter of the numerator of the percentage, not the denominator. For example, if a percent referred to the percentage of males

enrolled in college whose families had income of less than \$10,000 per year in October 1976, then the factor 1.2 for income of total persons is used.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number shown in this report can be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

In this formula f is the appropriate factor from table C-8 and σ is the standard error for total or White persons in table C-2, the standard error for Black and other races persons in table C-3 or the standard error for Spanish origin persons in table C-4.

Standard error of estimated percentages. The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the

Table C-2. Standard Errors for Estimated Numbers of Persons Enrolled in School

Total or White Population

(68 chances out of 100. Numbers in thousands. For meaning of symbols, see text)

Estimated number of persons	Total persons in age group

50,000.....	-	-	-	-	-	-	-	-	-	232.9
75,000.....	-	-	-	-	-	-	-	-	-	201.7
100,000.....	-	-	-	-	-	-	-	-	-	-

Note: To estimate the standard errors for the period 1956 to 1966, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

numerators of the percentages, particularly if the percentages are 50 percent or more. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula:

$$\sigma_{(x,p)} = f\sigma \quad (2)$$

In this formula f is the appropriate factor from table C-8 and σ is the standard error for total or White persons in table C-5, the standard error for Black and other races in table C-6, or the standard error for Spanish origin persons in table C-7. When the numerator and denominator of the percentage are in different categories, use the table and factor indicated by the numerator.

Illustration of the use of tables of standard errors. Table A-4 of this report shows that in October 1976 there were 1,546,000 women 18 and 19 years old enrolled in college. The estimated total number of women 18 and 19 years old from table C-9 is 4,189,000. The factor in table C-8 for education, total or White, is 1.0. Using both the 4,189,000 estimated women in the age group and the estimated 1,546,000 women in the age group in college with table C-2 and formula (1), an approximate standard error of 42,000 = (42,000 x 1.0) is obtained. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 42,000. The chances are 95 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 84,000 (twice the standard error).

Table A-5 shows that 17.1 percent of the 749,000, 18 to 24 year old male dependents in families with incomes less than \$3,000 were enrolled in college in October of 1976. The factor in table C-8 for education, total or White is 1.0. Interpolation in table C-5 shows the standard error of 17.1 percent to be 2.0 percent. Thus, the standard error of 17.1 percent for education is 2.0 = (2.0 x 1.0). Consequently, the chances are 68 out of 100 that the estimated 17.1 percent would be within 2.0 percentage points of a complete census figure. Chances are 95 out of 100 that the estimate would be within 4.0 percentage points of a complete census figure, i.e., the 95-percent confidence interval would be from 13.1 to 21.1.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squared standard errors of the estimates; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Table A-5 shows that 54.5 percent of the 1,253,000 18 to 24 year old male dependents in families with incomes \$15,000 and greater were enrolled in college in October of 1976. The apparent difference between the 17.1 percent of 18 to 24 year old male dependents in families with incomes

Table C-3. Standard Errors for Estimated Numbers of Persons Enrolled in School

Black and Other Races

(68 chances out of 100. Numbers in thousands. For meaning of symbols, see text)

Estimated number of persons	Total persons in age group						
	100	250	500	1,000	2,500	5,000	10,000
10.....	4.8	5.0	5.0	5.0	5.1	5.1	5.1

Table C-5. Standard Errors of Estimated Percentages

Total or White Population

(68 chances out of 100)

Base of percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
100.....	2.0	3.1	4.3	6.2	7.2
250.....	1.3	2.0	2.8	4.0	4.5
500.....	0.9	1.4	1.9	2.8	3.2
1,000.....	0.6	1.0	1.4	2.0	2.3
2,500.....	0.4	0.6	0.9	1.2	1.4
5,000.....	0.3	0.4	0.6	0.9	1.0
10,000.....	0.2	0.3	0.4	0.6	0.7
25,000.....	0.13	0.2	0.3	0.4	0.5
50,000.....	0.09	0.14	0.2	0.3	0.3
100,000.....	0.06	0.10	0.14	0.2	0.2

Note: To estimate the standard errors for the period 1956 to 1966, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

less than \$3,000 enrolled in college and the 54.5 percent described above is 37.4 percent. The standard error, σ_x , of 17.1 percent is 2.0 percent as shown above. The factor from table C-8 appropriate for the 54.5 percent is, again 1.0. Table C-5 shows the standard error of 54.5 percent on a base of 1,253,000 to be 2.1 percent. Thus, the standard error, σ_y , of the estimate is also 2.1 = (2.1 x 1.0).

To get the standard error of the estimated difference, $\sigma_{(x-y)}$, use the following formula:

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2}$$

Therefore the standard error of the difference of 37.4 percent is $2.9 \div \sqrt{(2.0)^2 + (2.1)^2}$. This means the chances

are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than 2.9 percent. The 68 percent confidence interval about the 37.4 percent difference is from 34.5 to 40.3, i.e., 37.4 ± 2.9 . A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95-percent confidence interval is 31.6 to 43.2. Thus, we can conclude with 95-percent confidence that there is a significant difference between the percentage of 18 to 24 year old male dependents in families with incomes less than \$3,000 enrolled in college, and the percentage of 18 to 24 year old male dependents in families with incomes \$15,000 or greater who were enrolled in college.

Table C-6. Standard Errors of Estimated Percentages

Black and Other Races

(68 chances out of 100)

Base of percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
